

DISCHARGE SUMMARY

NAME	DR.	Guattery	ROOM NO.	-HOSP. NO.
MITTED	4-15-82	DISCHARGED	8-3-82	FROM TO
			NEW HOSP NO.	

FINAL DIAGNOSIS:

Acute abdomen with peritonitis and perforated diverticulum from diverticulitis.  
C.V.A. with left hemiparesis, treated and improved.  
Acute myocardial infarction, treated and improved.  
Anxiety reaction associated with presenile state.  
Intertrochanteric fracture, right hip, surgically treated, improved.

SURGICAL PROCEDURE & DATE:

Laparotomy with biopsy of omentum, 4-15-82.  
Richards compression right hip pinning, 4-26-82.

PLEASE COMPLETE THIS FORM IN FOLLOWING ORDER:

History, Physical Findings, Laboratory & X-ray Data, Course and Disposition

This lady was admitted to the Hospital on 4-15-82 because of acute abdominal pain which was thought to be an intestinal obstruction. She underwent surgery for attempted relief of this by Dr. Carpenter, at which time it was found that she had an acute diverticulitis with perforation. Following the surgery, she developed a sepsis which was treated. She then had chest pain with findings compatible with acute M.I.

On 4-24 she fell out of bed and developed an intertrochanteric fracture of the right hip which was surgically repaired by Dr. Carpenter. Following this, she did well for a brief period only to develop acute left hemiparesis and a confusional state. She gradually regained muscular movements of the left side. Was able to speak. According to the Physiotherapy Department, she was resistive to training for ambulation.

She survived all of this trauma and was able to be discharged on 8-3-82 to Elm Manor. Patient will be followed at Elm Manor.
